Digital Transformation

Broadcast → Network Fabric

- “One-to-Many” becomes “Service Mesh Architecture”
- IP, ATSC3.0, 5G network evolution
- Edge compute & 5G networks = “Internet of Things”

Decentralized Content Fabrics re-defining Core vs. Edge

- Intelligent network routing using machine learning
- Just in time rendering of content increases edge efficiency

IT Transformation

Virtualization of Server & Network applications

- Hyper-converged Infrastructure
- Software-defined storage & networking

Workflow Orchestration

- Enterprise Service Bus (~2003)
- Service Oriented Architecture (~2008)
- API layers replacing individual hardware drivers (~now)

Workforce Transformation

Migrating project-based creative talent = most time and cost

- Virtualizing creative applications next step
- PCoIP protocol for remote workstations
- Hypervisor for fully virtualized environments

Multi-cloud for global collaboration

- On-premise file for high-throughput, low-latency workflows
- Object store becomes globally accessible asset library
- Hybrid Private/Public cloud with workload mobility

Security Transformation

Media Technology Priorities - 2019

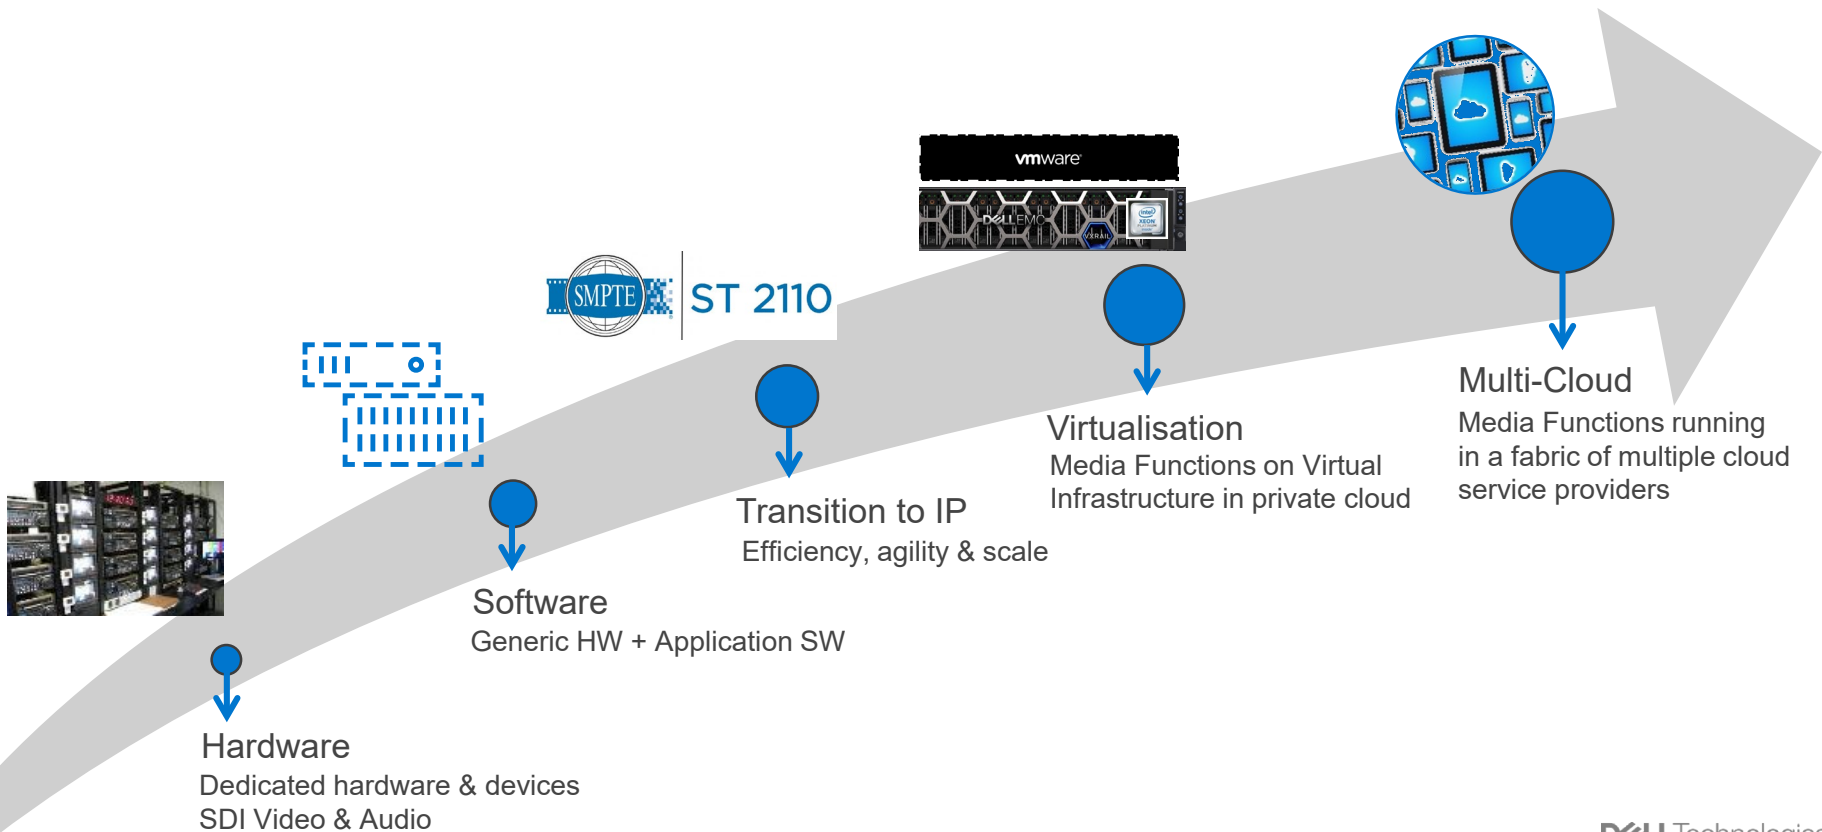

Source: IABM / Devoncroft

JT-NM “Dematerialized Facilities” in 2017

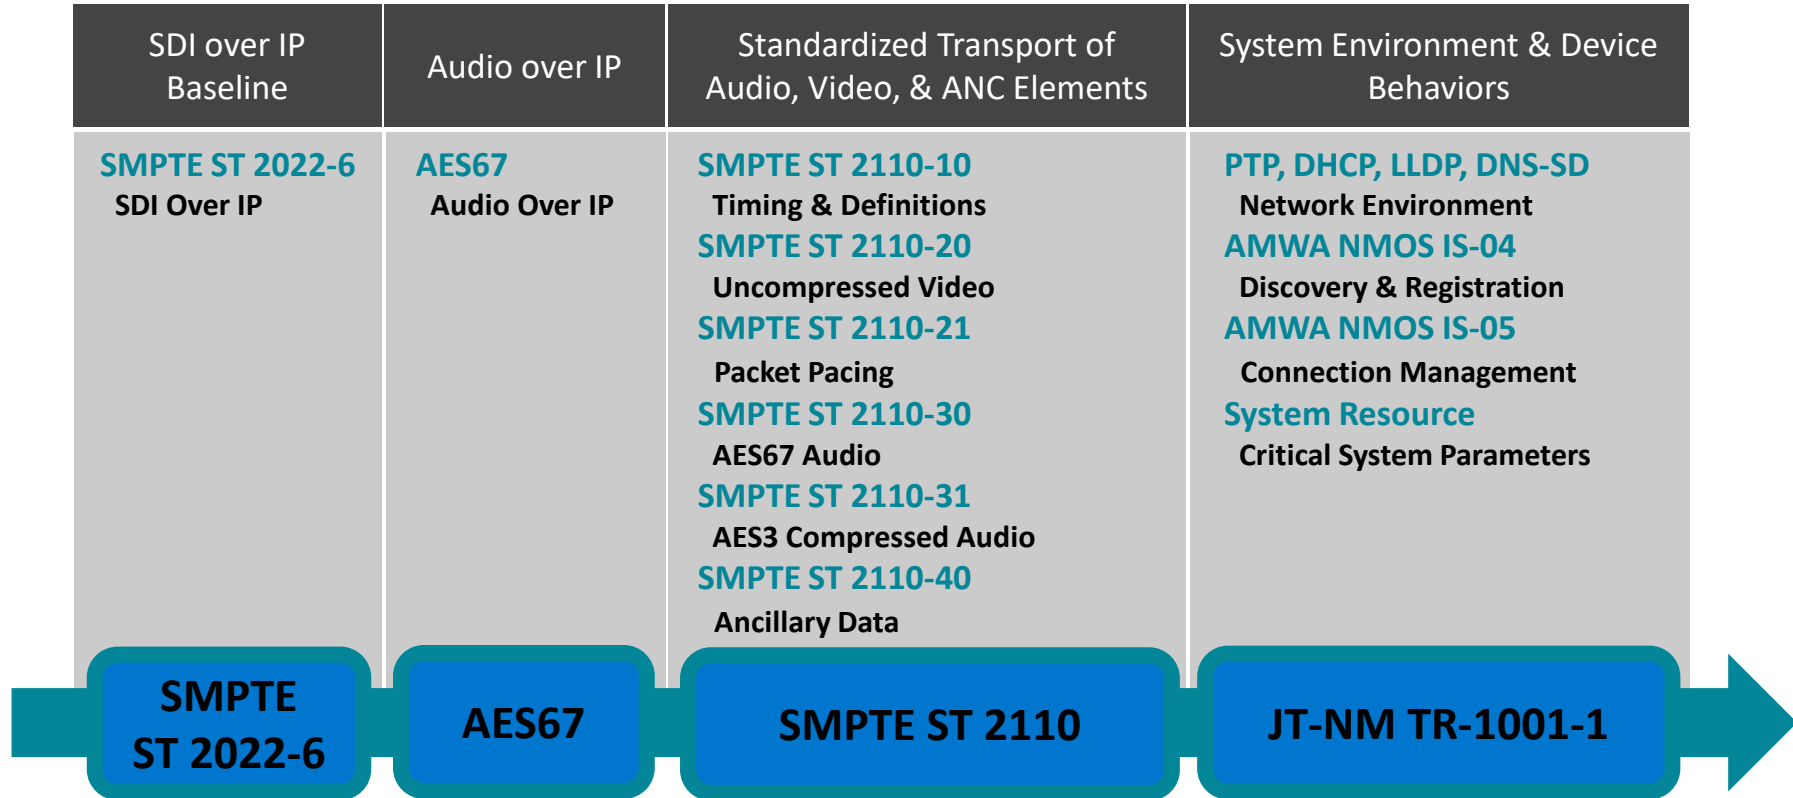

- “A broadcast facility operating on generic IT equipment either contained locally, or a remote facility operated by others”
- Runs on virtual machines
- Uses “Non-Media specific” COTS hardware to rapidly scale up or down
- Open architecture using self-describing APIs

Media Function Virtualisation Journey

AIMS Roadmap – July 2019

Pushing uncompressed IP flows through vNICs

The image shows a screenshot of a presentation slide displayed within an Adobe Acrobat Pro DC window. The window title is "Media and Entertainment Workloads on vSphere 6.7: Best practices and recommendations for deployment and performance tuning - Adobe Acrobat Pro DC". The slide content includes:

- Media and Entertainment Workloads on vSphere 6.7**
- Best practices and recommendations for deployment and performance tuning
- March 27, 2019

The slide features a blue geometric graphic in the top-left corner. The Adobe Acrobat interface includes a menu bar (File, Edit, View, Window, Help), a toolbar with navigation and editing tools, and a "Share" button in the top right. The Windows taskbar at the bottom shows several open applications: SMPTe ATL, Calendar - Thomas..., SMPTe Atlanta.ppt..., and Media and Entertai... The system tray in the bottom right corner displays the time as 2:26 PM on 8/12/2019.

FPGA integrated with Network interface

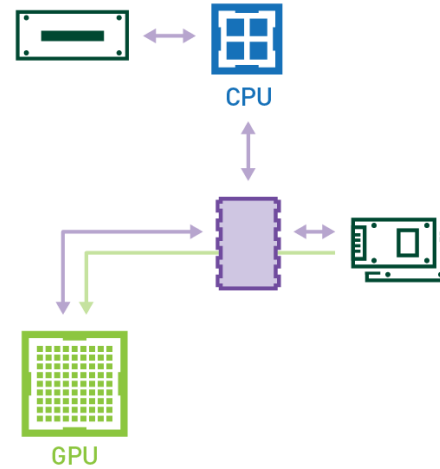

- Traffic shaping, natively offloaded and further customized via FPGA logic
- Video down-sampling for multi-viewer applications
- Hitless switching for video redundancy

Moving data from Storage to GPU

Without GPUDirect Storage

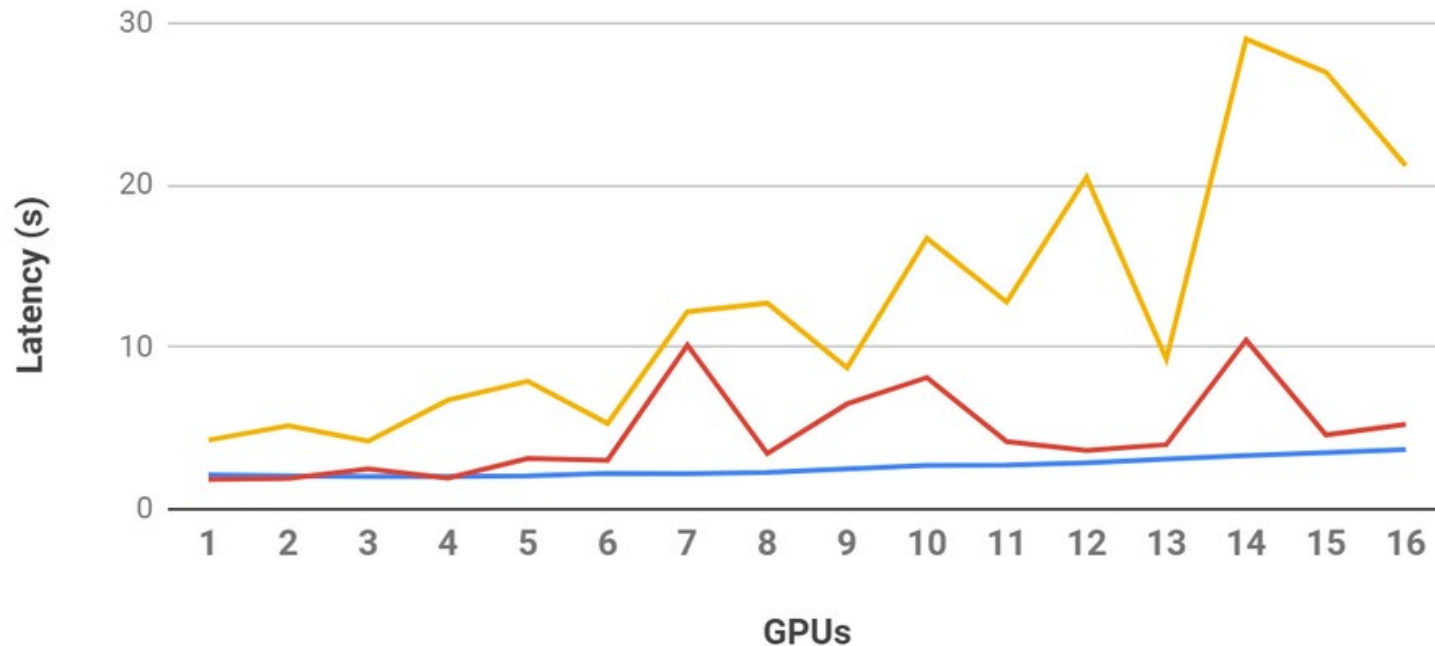

With GPUDirect Storage

Latency improvements with GPU Direct access

Average Worker Latency

- GPU Direct Storage
- cuDF optimized - bounce buffer but no faulting
- Original cuDF with faults, bounce buffer, unpinned

The 'burst buffer' tier is attached to the Dell 25GbE infrastructure switches (upstream of optical switches) and is invoked when traffic is 'out-of-contract' i.e. above the contracted bandwidth so no bits are 'lost.'

The 'fast cache' tier is inline with datapath and sits downstream of the Dell 25GbE infrastructure switches before packet decoding / transcoding'

The 'capacity storage tier is attached (via 25GbE infrastructure switch) to the fast cache and provides 'long' term storage of every bit transmitted (ages out unused / unaccessed / unwanted content if capacity rise above pre-set limit?)

Hyper-converged Infrastructure

- Broadcast ISVs getting out of hardware business
- Virtualized Application, Network and Storage stacks
- Infrastructure upgrades must treat the entire technology stack like connective tissue
- You can't isolate one layer, you must advance them all together

Software-defined Networking (aka Ethernet Fabrics)

- **Benefits**

- Scales to a higher amount of nodes (250), could go higher in future
- Removes requirement for large Carrier Grade Switches
- Switches used are 1U Multirate non-blocking (10, 25, 40, 50, 100 Gb/s)

- **Notes**

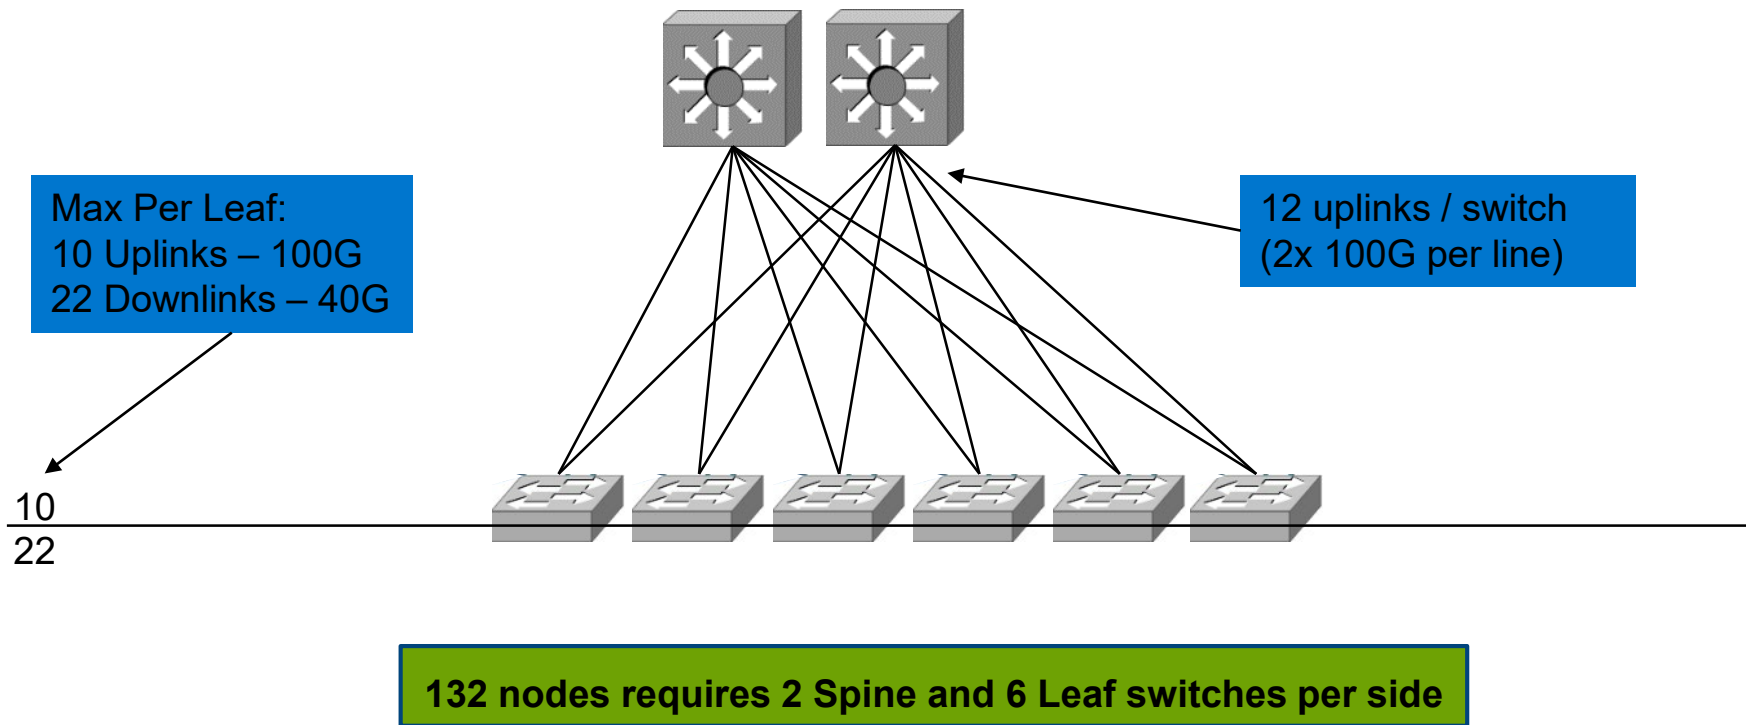

- Same switches supported for both leaf and spine
- Full bandwidth throughput, non-blocking, 22x 100Gb/s connections down, max of 10 up
- Switches are in leaf or spine mode, all auto negotiated
- LBFO daemon will monitor paths between nodes
- `isi_dump_fabric int-a` – to show fabric map.

Software-defined Networking

- Spine – Leaf architecture
- Service Meshes
- Distributed CDNs
- 5G Networks
- Multi-access Edge Computing
- High bandwidth, low-latency

132 Node Leaf-Spine Example

250 Node Leaf-Spine Example

Per Leaf:
10 Uplinks – 100G
22 Downlinks – 40G

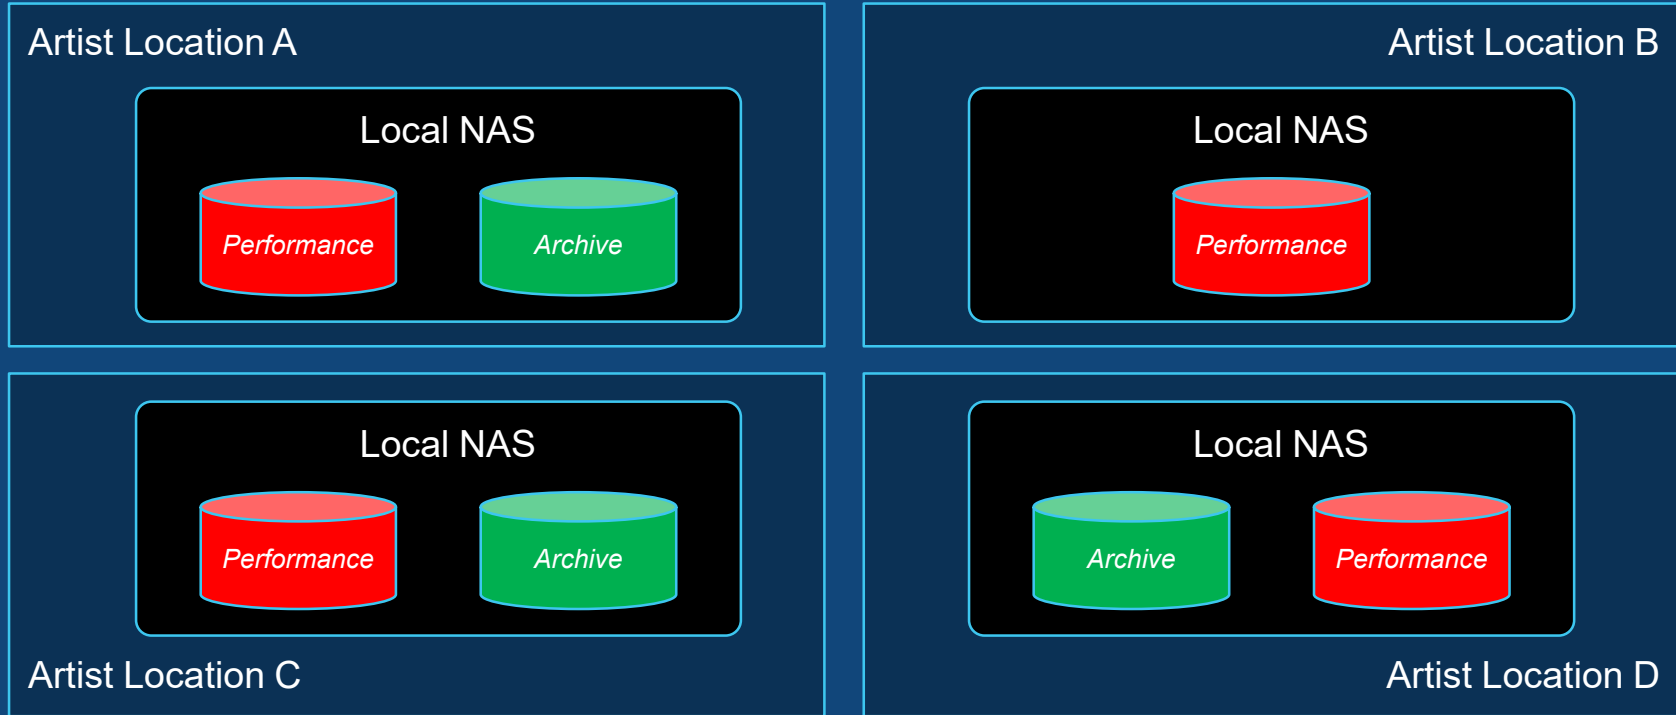

24 uplinks per spine
(2x 100G per line)

10
22

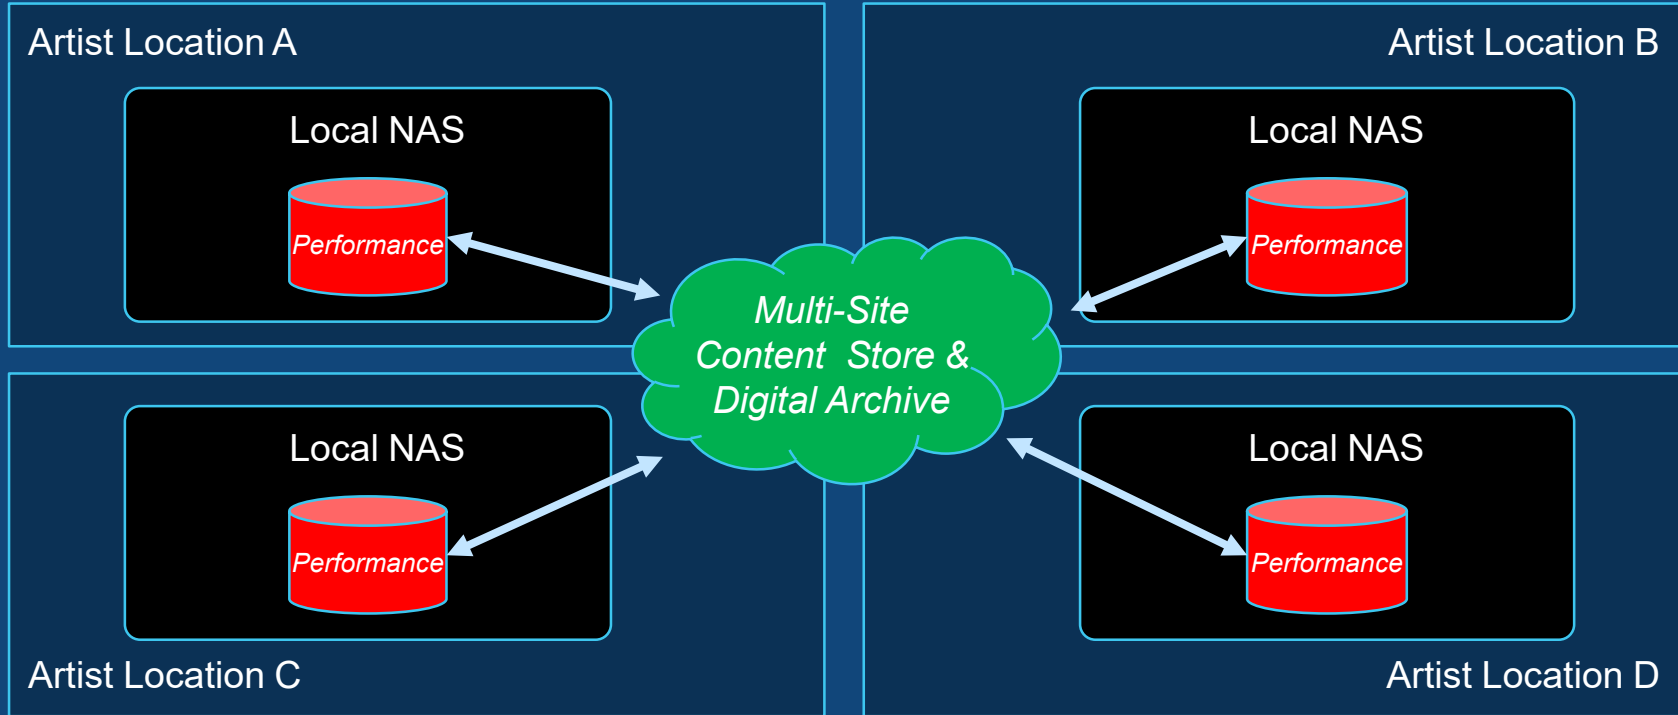

250 nodes requires 5 Spines and 12 Leafs per side

DELLTechnologies

LTO tape library migration

- Rights holders need to migrate LTO versions regardless
 - Disk-based active archive more responsive
 - Too much content to manually tag
 - AI techniques yield extended metadata
 - Speech-to-text
 - Actor / player recognition
 - Object recognition
 - Sentiment analysis
 - Searchable video
- Decision support for Asset Library monetization
 - Is this title worth cleaning up and re-mastering for new forms of distribution?
- Need to extract existing proprietary metadata
 - Oracle DIVA
 - MASSTech
 - Interplay
 - Quantum File Manager
 - Other MAM
- Multi-year process for large asset libraries
 - Labor-intensive
 - Offsite copies of LTO media
 - Ongoing operations during migration

Advertising analytics

- Trained human logger is 25% efficient
 - 2 hours of material tagged in 8-hour shift
 - Spotting sponsor logos and car numbers
- PoC with large telco == 67% efficient
 - ID'd car numbers when partially obscured
 - Better at wraparound sponsor logos
 - Increased advertiser CPMs

Restoration Optimization

- Pix2Pix
 - Generative Adversarial Network
 - Runs under TensorFlow
- <https://hackernoon.com/remastering-classic-films-in-tensorflow-with-pix2pix-f4d551fa0503>
- Remastering workflow for Netflix
 - AI-based EDL matching faster than editor

Genetic GANs: creating people who don't exist

Decentralized Content Fabric replacing CDNs

Intelligent Network Routing using Machine Learning

- Web-scale, “nothing-shared” distributed store of media and metadata
- Integrated blockchain ledger
 - mediating content versioning; access control,
 - programming business workflow logic in “smart contracts“
 - validation, rights management, sponsorship and monetization
- New machine learning algorithms
 - clients have consistent high bandwidth streaming with minimal latency
- Fully utilize system compute and bandwidth resources
 - minimize core transit bandwidth
- Just-in-time media rendering capability
 - dynamic bitcode execution within the fabric
- Content encrypted end-to-end
 - 'trustless' relationship with the fabric
- Economic incentives for trusted participation
 - some operations must occur on unencrypted content

The background features a gradient from dark blue on the left to purple on the right. Overlaid on this is a complex network of thin white lines connecting various-sized white dots, creating a web-like or molecular structure.

Thank You!
