

QC Testing using Artificial Intelligence

—

Visual Perception: Block Diagram

Visual Perception Major Factors - Simplified

- Eye Movement
 - Constant Subtle Tracking
- Receptor Persistence and Sensitivity
 - Maximize Contrast to detect changes in illumination and color
- Conditioned Experience
 - Personal Knowledge of Objects and Conditions

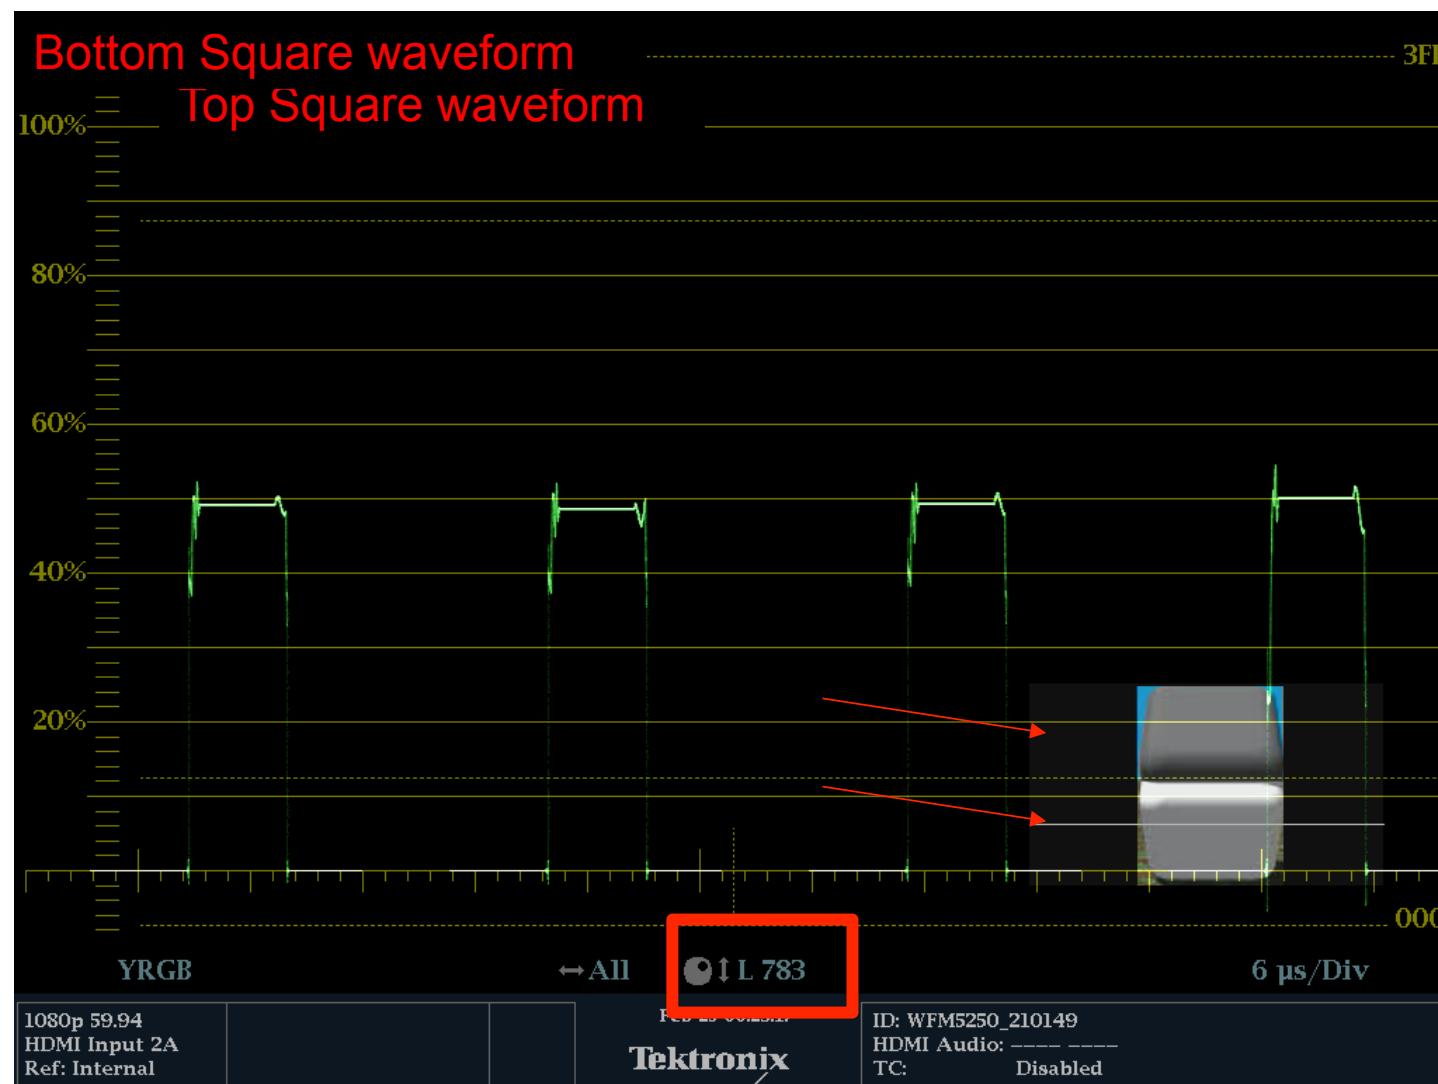

Visual Perception: Persistence of Vision

Can you trust your eyes?

Are these squares the same color?

Blur

Mean Opinion Score (MOS) Method Human

- **Step 1** - Show the test audience the best-case training clip
 - This is generally the original unimpaired video clip
- **Step 2** - Show the test audience the worst-case training clip
 - This is generally the most heavily-impaired version of the reference clip that you will ever ask this test audience to evaluate
- **Step 3** - Show the test audience any number of video clips and ask them to evaluate each on a scale of 1 to 5
 - These video clips are often, but not always, the same content as the best and worst case but with varying degrees of impairment
 - MOS of 1 = As bad as the worst-case training clip
 - MOS of 5 = As good as the best-case training clip
- **Step 4** - Calculate the mean average of all viewers' scores for each test clip to produce a final MOS score

Mean Opinion Score

WHAT IS MOS?

- Arithmetic mean over single ratings performed by human subjects for a given stimulus in a subjective quality evaluation test

Rating	Label
5	Excellent
4	Good
3	Fair
2	Poor
1	Bad

MOS Example

Rating	Label
5	Excellent
4	Good
3	Fair
2	Poor
1	Bad

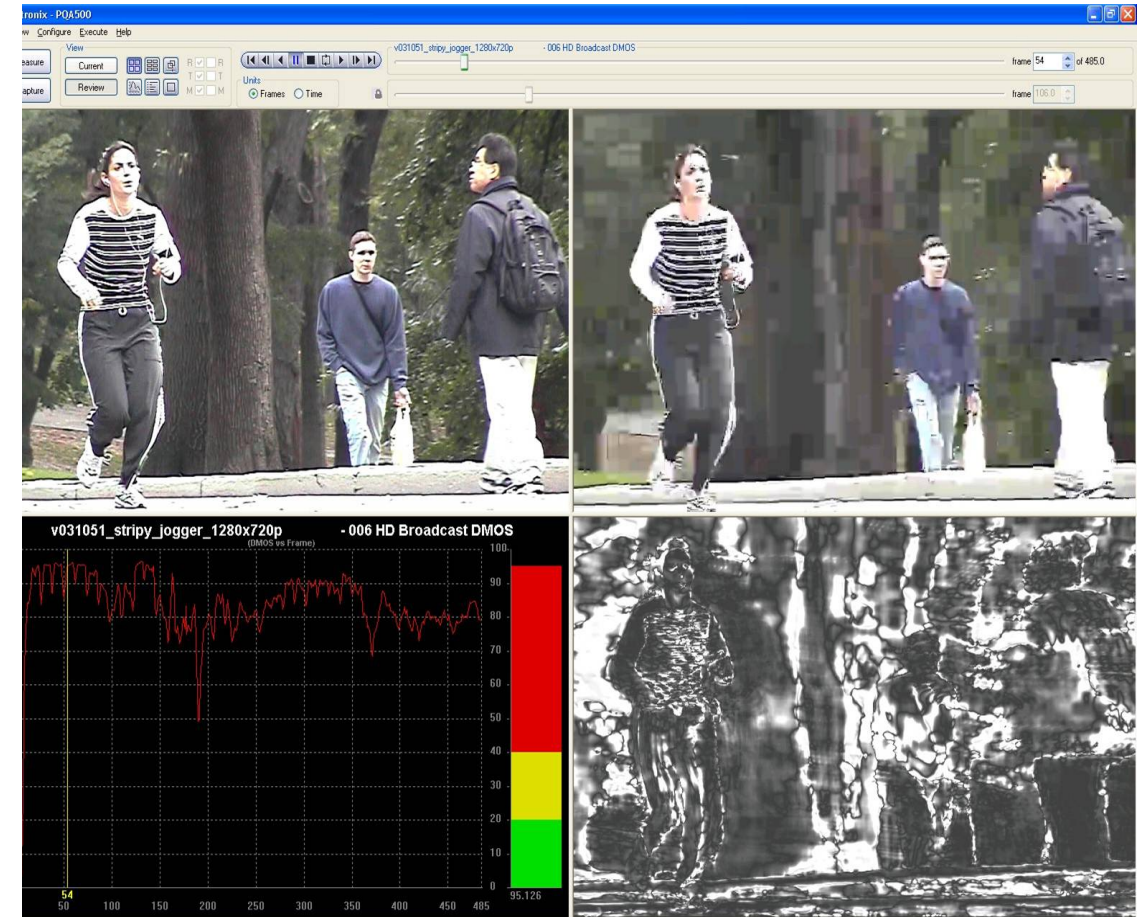

$$\frac{5 \times 3's + 7 \times 4's}{12} = 3.58$$

This is your final MOS score

PQA500 Picture Quality Analysis

- Fast, Accurate, Repeatable, Objective Picture quality measurement
- Picture quality measurement based on Human Vision System Model.
 - DMOS & PQR
- Picture quality comparison across different resolutions and frame rates
 - HD, SD, CIF
- Attention/Artifact weighted measurement
- Automatic temporal and spatial alignment

PQA600 Patents

US 8,229,229 Systems and methods for predicting video location of attention focus probability trajectories due to distractions

US 8,754,988 , 8,963,998 Full reference system for predicting subjective quality of 3D video

US 6,975,776 Predicting human vision perception and perceptual difference

US 6,941,017 Temporal processing for real-time human vision system behavior modeling

US 6,678,424 Real-time human vision system behavioral modeling

The New Way of Evaluating Video Quality

No Reference Picture Quality Measurements

- **Single ended MOS score typically running in real-time but difficult to correlate** with subjective score
- **Difficult to extract parameters** from image well correlated to **subjective assessment on their own**
- **No temporal or spatial alignment needed.** Operate on multiple image quality scales or formats
- **No secondary path needed**

No-Reference MOS Scoring Test

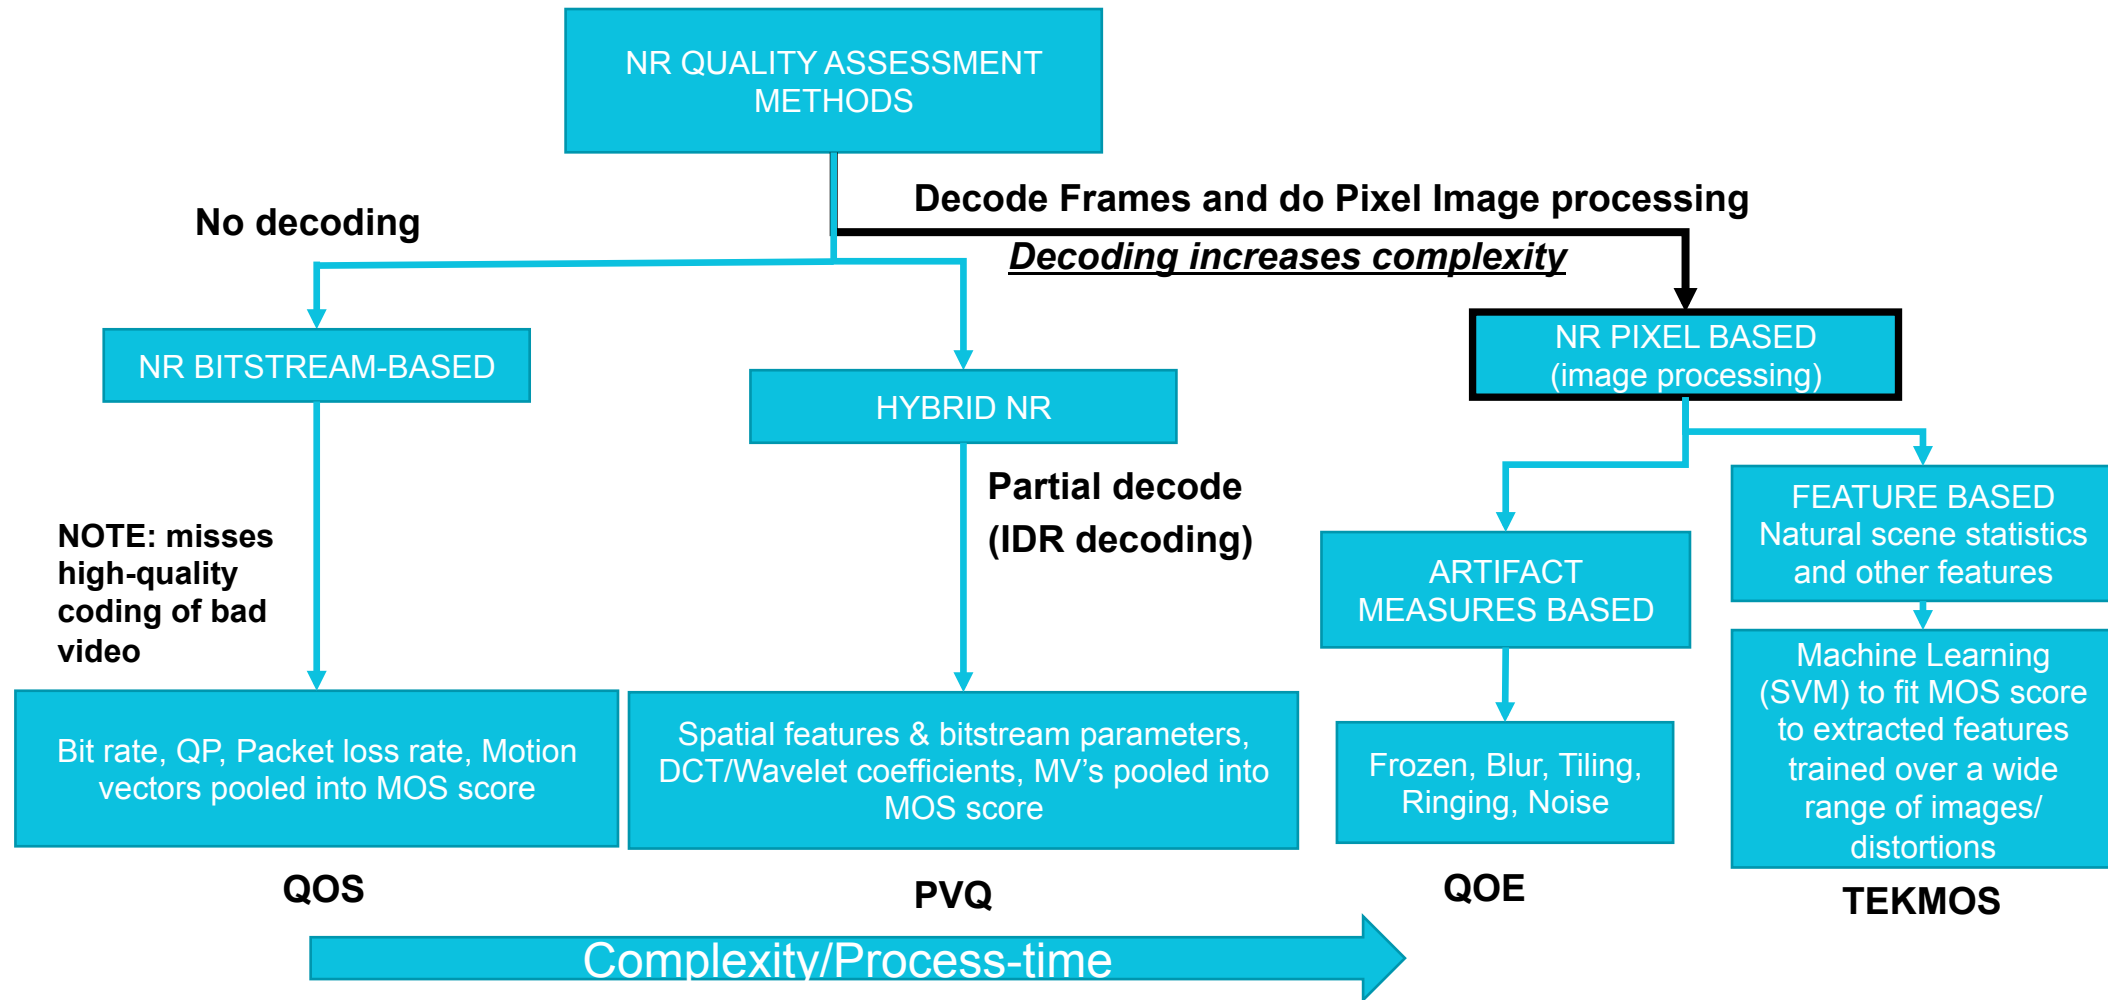

Sometimes the thing that is holding you back...

...is all in your head.

No-Reference (blind) PQ Measurements

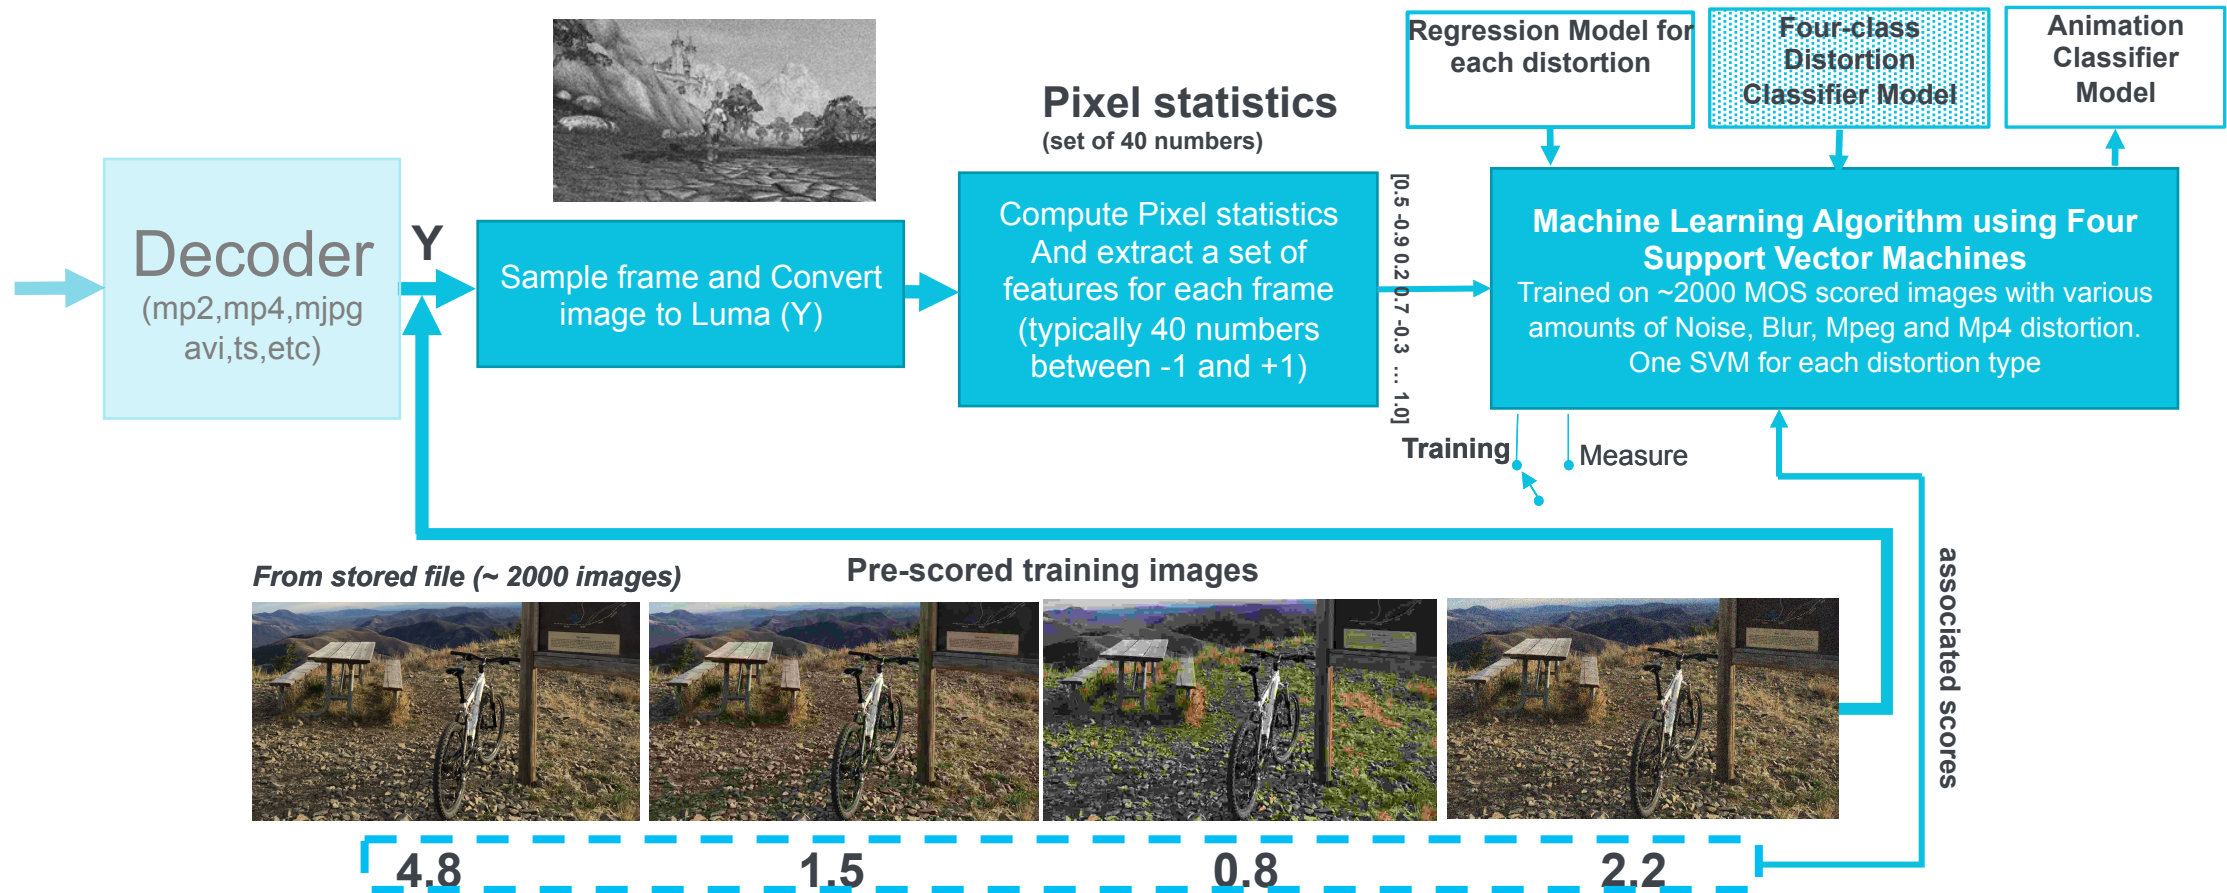

TekMOS

PROPRIETARY TEKTRONIX MEASUREMENT

- Non-Reference Picture Quality metric
 - Single-ended measurement
 - Can be performed on file-based content or live signals equally well
- ***Training Mode*** used by Tektronix engineering to build a model from an image library, scored with and without various distortions
- ***Measurement Mode*** used in product implementations to compute score for arbitrary input images

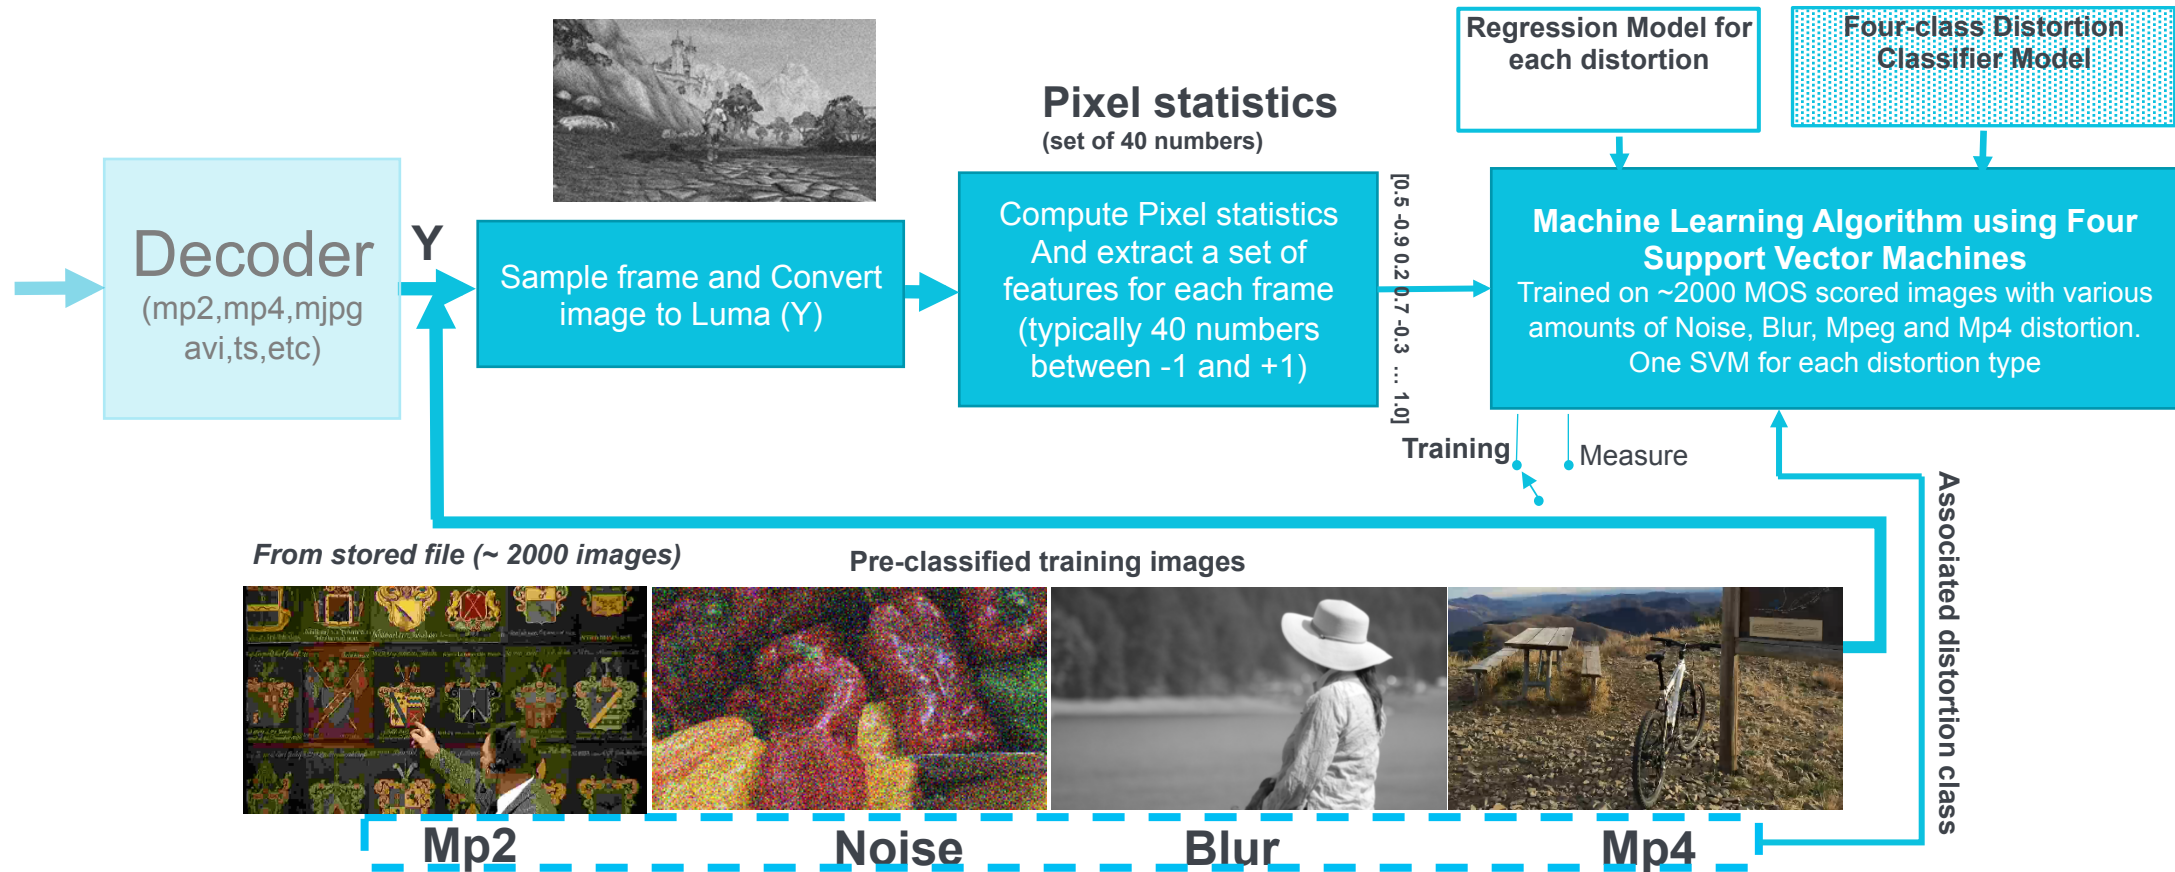

TekMOS Block Diagram

TRAINING MODE TO CREATE REGRESSION MODEL

TRAINING MODE FOR DISTORSION CLASSIFICATION

TekMOS Block Diagram

MEASUREMENT MODE

(Distortion Probabilities)

(Regression Scores for each Distortion)

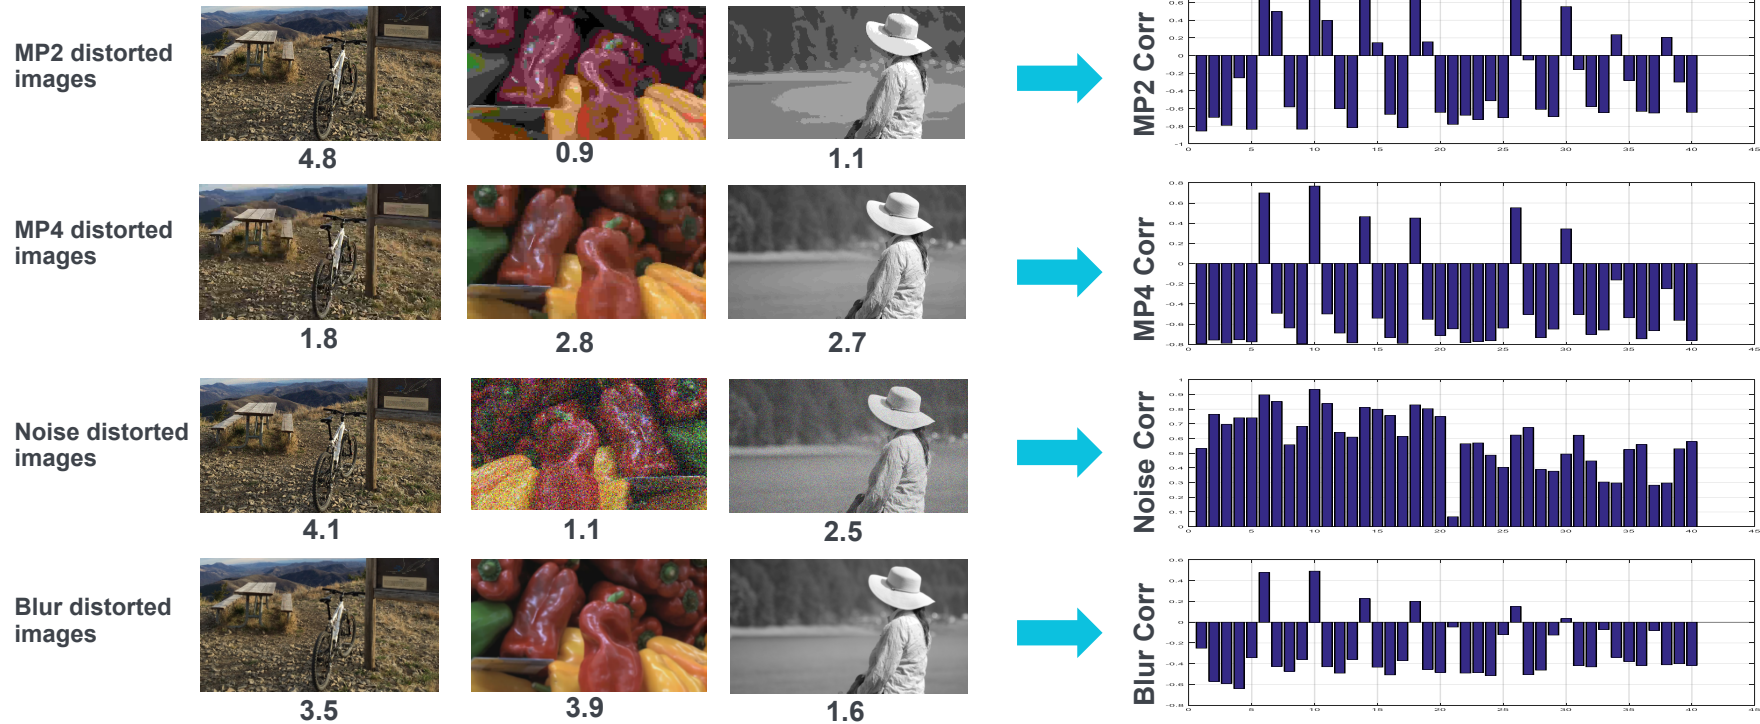

Overall score= [0.02 0.08 0.80 0.1] * [10 25 40 8] = 35;

(vector dot product)

MOS = (100-35)/20 = 3.25 mp4 (not animation)

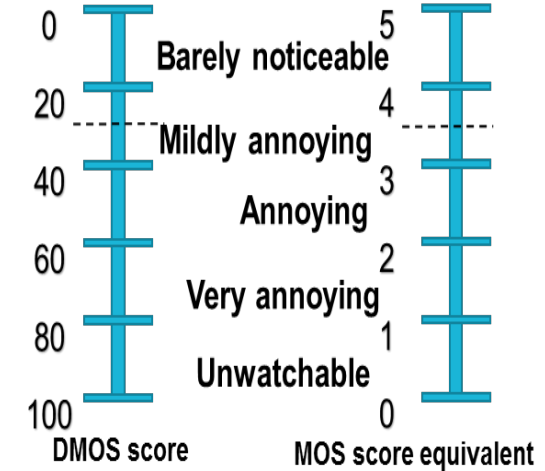

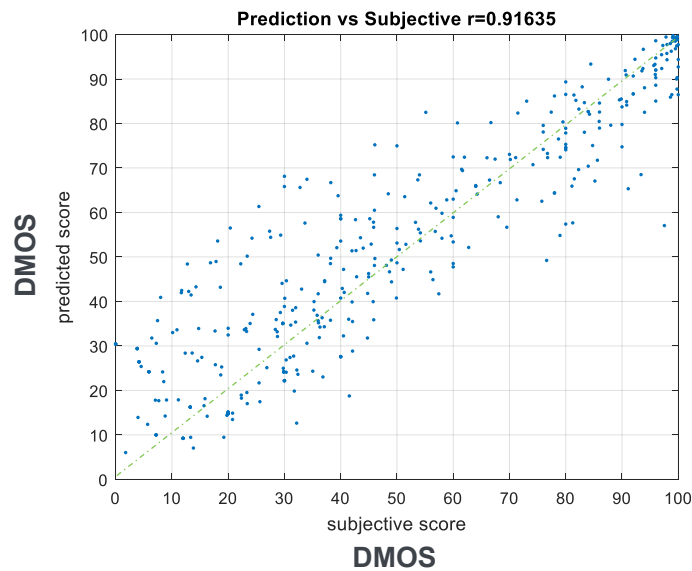

Distortion Classes

FEATURE-TO-SCORE CORRELATIONS

TekMOS Test Scoring Results (392 test images)

OVERALL SCORE CORRELATION AND CORRELATION BY DISTORTION CLASS

Total, Distortion-weighted Correlation:
PLCC= 92%
SRCC=91%
Sigma=9.6 (~0.5 MOS)

MOS=4.3 BLUR 74%

MOS=2.9 BLUR 91%

MOS=3.1 MPEG2 85%

MOS=2 MPEG2 84%

MOS=2.6 NOISE 97%

MOS=1.4 NOISE 90%

Measurement Enhancements

TEMPORAL DECAY FILTER

- **Very short durations** of a few contiguous frames of lower quality are not typically noticed
- **Temporal decay filter** acts like a RC filter similar to a PPM meter with an exponential decay
 - Adjustable time-constant (0 to 20 seconds)
- If the sequence of **low-quality frames persist**, then the score settles to the low value as set by the time constant thereby **lowering the overall average** score for the clip

Measurement Enhancements

REGION OF INTEREST

- Detect and grade only the region with highest amount of details in the frame

TekMOS machine learning picture quality

No-reference measurement enables operations monitoring at scale

- Live and VOD
- Single view of TekMOS, QoS, and QoE with Reason Codes
- Machine learning non-reference with good correlation to human score
- Practical for multi-stream monitoring applications
- Detects source & encoding degradations
- Adjustable threshold alerts

Measurement Results

TEKMOS GRAPH

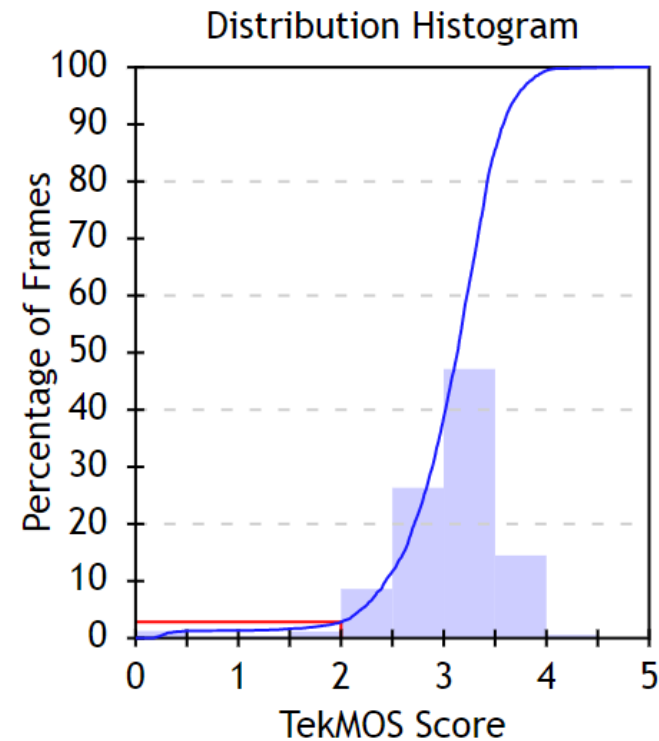

- Displays TekMOS scores for entire video stream in one graph
- Divides play duration into ~120 time segments
 - Light colored bars represent minimum & maximum TekMOS scores
 - Darker line represents average TekMOS score per segment

Measurement Results

DISTRIBUTION HISTOGRAM

- Helps the user determine their desired template threshold values
- Light colored bars show percentage of scores in each “bucket” (0.5 score resolution)
- Darker line shows the cumulative percentage of frames worse than a specific score
- Red lines intersect for the Program Threshold

Measurement Results

DISTORTION MAP

- Colored bands in the “negative space” between 5.0 and the measured TekMOS score shows the probability that the score is caused by one of four distortion classes
- Vertically aligned with TekMOS avg/min/max graph to help isolate locations and determine the underlying reasons

Tek Mos Machine Learning NR (blind) PQ

ADVANTAGES OF MACHINE LEARNING APPROACH TO PQ

- Can be trained for **any distortion type in any combination**
- Can be used as Classifier to estimate **Distortion Type** as well as **MOS score**
- Each training creates a model for the SVM. User can select different models based on preferences of scoring criticality.
- Possible to allow **customer training to create custom models** from private set of images with customer preferred subjective scoring.
- Can be **easily re-trained to create models** that focus on particular current or future compression distortions

TEKMOS & PQA

COMPLEMENTARY TOOLSETS

	TEKMOS	PQA
Type of Measurement	No-Reference	Full-Reference
Result	MOS – 5 to 1	DMOS 0 to 100
Method	Machine Learning	Human Vision System
Performance	Faster than Real-time at 1080p	5-10X Real-time at 1080p
Optimal Use cases	Operational Monitoring “does the quality level meet expectations over time?”	Encoder/Decoder Evaluation “are these components fully optimized?”

The background features a large, semi-transparent watermark of the Telestream logo. The logo consists of a blue arc above the word "Telestream" in a white, sans-serif font. The watermark is centered and spans most of the width of the image.
